H2: issuance-repayment asymmetry

Level change in e (USD per NZD)

Test	Estimate	HAC Std. Err.	Statistic	H_a	p-value	[95% Conf.	Interval]
event-day equal/opposite effect	-1.723×10^{-8}	2.859×10^{-6}	-0.006 z	$\neq 0$	0.995	-5.620×10^{-6}	5.586×10^{-6}
full-window equal/opposite effect	1.838×10^{-5}	7.982×10^{-6}	2.303 z	$\neq 0$	0.021^{**}	2.735×10^{-6}	3.402×10^{-5}

100 x log change in e (USD per NZD)

Test	Estimate	HAC Std. Err.	Statistic	H_a	p-value	[95% Conf.	Interval]
event-day equal/opposite effect	2.403×10^{-5}	4.533×10^{-4}	0.053 z	$\neq 0$	0.958	-8.644×10^{-4}	9.125×10^{-4}
full-window equal/opposite effect	2.701×10^{-3}	1.189×10^{-3}	2.272 z	$\neq 0$	0.023^{**}	3.709×10^{-4}	5.030×10^{-3}

* $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$ (two-sided where applicable).

Joint tests use a robust Wald χ^2; contrasts use a normal z test (one-sided where H_a is > 0 or < 0). Estimates are sums of coefficients; confidence intervals are two-sided 95%.
