H1: anticipation (pre-event appreciation)

Level change in e (USD per NZD)

Test	Estimate	HAC Std. Err.	Statistic	H_a	p-value	[95% Conf.	Interval]
pre-event joint zero			14.418 $\chi^2(5)$	any $\neq 0$	0.013^{**}		
cumulative pre-event appreciation	4.368×10^{-6}	3.144×10^{-6}	1.390 z	> 0	0.082^{*}	-1.793×10^{-6}	1.053×10^{-5}

100 x log change in e (USD per NZD)

Test	Estimate	HAC Std. Err.	Statistic	H_a	p-value	[95% Conf.	Interval]
pre-event joint zero			13.580 $\chi^2(5)$	any $\neq 0$	0.019^{**}		
cumulative pre-event appreciation	6.524×10^{-4}	4.582×10^{-4}	1.424 z	> 0	0.077^{*}	-2.458×10^{-4}	1.551×10^{-3}

$^{*}\,p < 0.10$, $^{**}\,p < 0.05$, $^{***}\,p < 0.01$ (two-sided where applicable).

Joint tests use a robust Wald χ^2; contrasts use a normal z test (one-sided where H_a is > 0 or < 0). Estimates are sums of coefficients; confidence intervals are two-sided 95%.
